

SCRIBIFY AI — STUDENT EVALUATION REPORT

Student ID: Dhanya295

Total: 39/50
Percentage: 78.0%
Attempted: 11/11

Part A | Q1

Score: 2.0/2

Question: Define Artificial Intelligence (AI).

Student Answer: Artificial intelligence means the machine can think and act like human. It can learn from data and do tasks automatically without full human help.

- **Correct:** The student correctly identifies that AI involves machines that can think and act like humans. They also accurately include the ability to learn from data and perform tasks automatically, which are key aspects of AI's capabilities and part of the textbook's definition of AI being programmed to 'learn'.
- **Wrong / Missing:** The answer is very comprehensive. For absolute precision, it could explicitly use terms like 'simulation' of human intelligence and state that machines are 'programmed' to achieve this, as per the exact phrasing in the textbook's definition.
- **Improve:** For a perfect match with the textbook's specific wording, consider including 'simulation' and 'programmed' in your definition.
- **Ref:** Q1, Artificial Intelligence section

Part A | Q2

Score: 2.0/2

Question: List the main types of AI.

Student Answer: The main types are Narrow AI, General AI and Super AI. Narrow AI is what we use now, others are still developing.

- **Correct:** You correctly identified all three main types of AI: Narrow AI, General AI, and Super AI. Your understanding that Narrow AI is current and the other types are still developing aligns perfectly with the textbook's description of their current status.
- **Wrong / Missing:** No information was wrong or missing.
- **Improve:** For future questions, consider briefly adding the key characteristic of each type (e.g., Narrow AI is specialized for specific tasks) to further demonstrate your understanding, although your current answer was already excellent for the given marks.
- **Ref:** Section 2: What are the main types of AI?

Part A | Q3

Score: 1.5/2

Question: What is Machine Learning?

Student Answer: Machine learning is a part of AI where system learn from data and improve by experience. It not need to be programmed again.

- **Correct:** You correctly identified Machine Learning as a part of AI that learns from experience and improves without needing explicit reprogramming.
- **Wrong / Missing:** Your answer is missing the key aspect that Machine Learning uses algorithms to identify patterns in data.
- **Improve:** To make your answer more complete, add that ML systems use algorithms to find patterns in data.
- **Ref:** Section 3

Part A | Q4

Score: 1.5/2

Question: Define Neural Networks.

Student Answer: Neural network is like a human brain made by layers of neurons. It used for detecting image, sound, etc.

- **Correct:** You correctly identified that Neural Networks are inspired by the human brain, are made of layers of neurons, and are used for recognizing complex patterns like images or sound.
- **Wrong / Missing:** Your answer could be more precise by stating that Neural Networks are 'computational models' and explicitly mentioning that they 'process data inputs'.
- **Improve:** For a complete definition, remember to include that they are 'computational models' and explain their function of 'processing data inputs'.
- **Ref:** Textbook Context, Question 4

Part A | Q5

Score: 2.0/2

Question: What is Deep Learning?

Student Answer: Deep learning is a advance part of machine learning using many hidden layers. It helps in things like face recognition and speech recognition.

- **Correct:** You correctly identified Deep Learning as an advanced part of machine learning that utilizes multi-layered networks (implied by 'many hidden layers'). Your examples of face and speech recognition are also accurate applications.
- **Wrong / Missing:**
- **Improve:** For maximum precision, you could explicitly mention 'neural networks' when discussing the multi-layered structure.
- **Ref:** Q5

Part B | Q6

Score: 5.0/6

Question: Explain the main applications of Artificial Intelligence in real-world scenarios.

Student Answer: AI is used in many area like health care for predicting diseases, in cars for self driving, and also in phones for voice assistant. It also used in banking for detecting fraud. In education it helps student learning faster.

- **Correct:** You correctly identified several key real-world applications of AI, including its use in healthcare for disease prediction, self-driving cars for transport, voice assistants in phones, fraud detection in banking/finance, and personalized learning in education.
- **Wrong / Missing:** While your answer is strong, it did not include AI applications in entertainment, such as recommendation systems.
- **Improve:** To achieve full marks, ensure you cover all major application domains mentioned in the text. You could also briefly elaborate on one of your points, for example, how AI's role in personalized learning helps students by adapting content to their individual needs.
- **Ref:** Section 6 (Main applications of AI)

Part B | Q7

Score: 5.0/6

Question: What is Natural Language Processing? Explain its major use cases.

Student Answer: Natural language processing (NLP) is a method that make computer understand human language. Example are Google Translate, Chatbots and Siri. It help in communication between man and machine.

- **Correct:** You correctly identified that Natural Language Processing (NLP) enables computers to understand human language. Your examples of Google Translate, Chatbots, and Siri are excellent and accurately represent major use cases for NLP, aligning directly with the textbook's examples of language translators, chatbots, and voice recognition systems.
 - **Wrong / Missing:** While your definition is on the right track, it is not fully comprehensive. You missed stating that NLP is a 'field of AI' and that it also involves machines helping to 'interpret' and 'generate' human language, not just 'understand' it.
 - **Improve:** To improve your definition, remember that NLP is a specialized 'field of AI' and that its capabilities extend beyond just understanding to also include 'interpreting' and 'generating' human language.
 - **Ref:** Section 7
-

Part B | Q8

Score: 5.0/6

Question: Discuss the major ethical concerns in AI and how they can be mitigated.

Student Answer: The main ethical issue is bias in data, privacy problem, and losing of jobs. To fix this, AI should be trained on fair data and must follow some law or rule. Human monitoring is also needed.

■ **Correct:** You correctly identified bias in data, privacy issues, and job displacement as major ethical concerns in AI. Your proposed mitigations, such as training AI on fair data, implementing laws/rules, and requiring human monitoring, are relevant and valid.

■ **Wrong / Missing:** You missed mentioning 'accountability' and 'potential misuse of AI (e.g., surveillance, warfare)' as other key ethical concerns explicitly listed in the textbook. Your answer, while correct in its points, was quite brief and lacked the deeper 'discussion' expected, which would involve elaborating on why these are concerns and how the mitigations actively address them.

■ **Improve:** To achieve a higher score, ensure you cover all relevant points from the source material. Additionally, 'discuss' each point by explaining the 'why' (e.g., why bias is a concern) and the 'how' (e.g., how laws mitigate privacy issues), rather than just listing them.

■ **Ref:** Textbook, Section 8 (Ethical Issues)

Part B | Q9

Score: 5.0/6

Question: Describe how AI impacts the future of work with suitable examples.

Student Answer: AI will change job system. It will remove some manual job but also create new jobs like AI engineer. For example, robots in factory and chatbots in customer care are already replacing workers.

■ **Correct:** You correctly identified that AI will both remove existing jobs (like manual factory work or customer service with robots and chatbots) and create new job roles (such as AI engineers). Your examples are suitable and relevant.

■ **Wrong / Missing:** Your answer did not explicitly mention how AI automates repetitive tasks across various roles or increases overall efficiency in workplaces, which are key impacts on the future of work.

■ **Improve:** To provide a more comprehensive description, include how AI impacts existing jobs by automating routine tasks and boosting productivity, not just creating or replacing entire roles.

■ **Ref:** Textbook point 9

Part B | Q10

Score: 4.0/6

Question: Explain the future trends and directions of Artificial Intelligence.

Student Answer: In future AI will become more powerful with things like explainable AI and quantum AI. Robots will be more smart and we will see AI in all fields like education, medical and even space.

■ **Correct:** You correctly identified explainable AI and quantum AI as future trends. You also implicitly recognized the trend of AI-driven robotics ('Robots will be more smart') and the general direction of AI becoming integrated across various fields like education, medical, and space.

■ **Wrong / Missing:** Your answer is missing some key future trends mentioned in the textbook, specifically 'edge AI' and 'autonomous systems'. While you mentioned AI becoming 'more powerful', this is a general outcome rather than a specific trend listed.

■ **Improve:** To improve, ensure you include all the specific future trends listed in the textbook (e.g., edge AI, autonomous systems). Briefly describe each trend's significance or what it entails.

■ **Ref:** Q10

Part C | Q11

Score: 6.0/10

Question: Choose any one topic from Artificial Intelligence (e.g., NLP, Machine Learning, Deep Learning) and write a detailed essay discussing its principles, challenges, and applications in modern industries.

Student Answer: Machine learning is a part of AI which teach computers to learn by their own from data. It use algorithms like decision tree, regression and neural network. It is used in many industries like banking, healthcare, ecommerce. One big challenge is that it needs lot of data and powerful system. Sometimes the model overfit or not accurate because of bad data. Still it is helping to improve technology and making human life easy.

■ **Correct:** You correctly identify Machine Learning as a subset of AI that learns from data and mention relevant algorithms. Your discussion of challenges, including the need for large amounts of data, powerful systems, overfitting, and issues with bad data, is particularly strong and accurate.

■ **Wrong / Missing:** While you covered the key aspects (principles, challenges, applications), the answer lacks the detailed elaboration and structured format expected for an essay. Each point is stated briefly without further explanation or specific examples. For instance, explaining how overfitting impacts a model or providing concrete applications in industries (e.g., fraud detection in banking, personalized treatment plans in healthcare) would add significant depth.

■ **Improve:** To improve, structure your answer more clearly with an introduction, distinct paragraphs for principles, challenges, and applications, and a conclusion. Expand on each point with further explanation and specific, illustrative examples to demonstrate a deeper understanding.

■ **Ref:** Refer to 'What is Machine Learning (ML)?' and 'What are the main applications of AI?' for more detail.
